

FiberLocator

ARE YOU LOOKING FOR A FIBER DATA SOLUTION THAT IS TAILORED TO YOUR SPECIFIC BUSINESS NEEDS?

Look no further than **FiberLocator API Services.**

Our FiberLocator API enables you to integrate the industry's most current fiber and colocation infrastructure data within your own internal systems and databases, allowing you to leverage our powerful intelligence in your network and data center planning efforts.

WHAT DO YOU GET WITH FIBERLOCATOR API?

FiberLocator offers an application programming interface that gives you access to our database of carrier's fiber maps, lit building locations and data centers. We created our API services so you can augment your own systems and analyses with our unique, comprehensive data sets that you can push through instantly when you need them.

FiberLocator API enables you to custom integrate our continually updated fiber and colocation infrastructure information without storing the data or having to utilize the FiberLocator Online interface.

HOW DO WE DO IT?

Our system is built on a LAMP stack, and we use a REST API. You can pull FiberLocator data directly into almost any GIS based application or enterprise system. The instance we develop is unique to your business as each of our applications are custom-built to your specifications.

WHAT IS THE PROCESS TO GET UP AND RUNNING?

The FiberLocator team works with you to develop the API and program it to meet your specifications. We start by learning about your project—what your specific requirements are, the specific data sets you are looking for, as well as your intended end use. One of our programmers will develop the instance just for you, creating a winning formula with our data and your system!

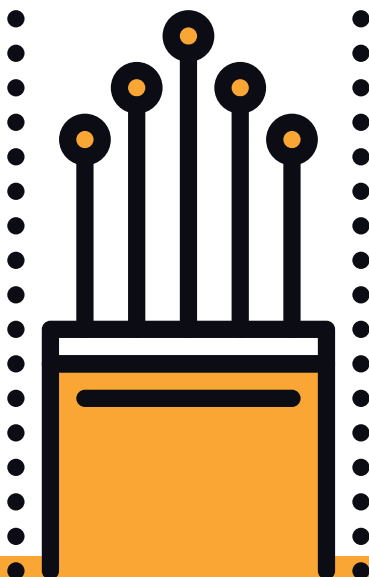

We can get a beta program set up in approximately one week and roll out the finished product within 30–45 days.

WHY FIBERLOCATOR?

FiberLocator was originally developed as an internal research and sales tool. We compiled and standardized map data for hundreds of facilities-based carriers and hundreds of thousands of lit buildings and data centers across the US.

FiberLocator data allows you to quickly identify the optimal providers and network locations, measure fiber distances, see lit buildings and much more.
